White Light Velocity Interferometry of Imaged Surfaces
David Erskine

Uncollimated incoherent light (a cheap camera flash) can be used to measure velocity over a surface interferometrically. Use of broadband waves (light, sound, microwaves) allows range and velocity to be measured precisely simultaneously (without violating the uncertainty principle), devoid of speckle problems.

This work was performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under contract No. W-7405-Eng-48.
